

# Kodmyran Commerce Wolfpack

Author Kodmyran AB

## Introduction

KQL, or Kodmyran Query Language, is a query language that can be used against any entified entity in the platform. It allows you to issue arbitrary queries in the platform that can be used to select e.g. products in a category search or filter your responses in the new admin portal.

## Restrictions

KQL is still work in progress and has numerous limitations at this point, but can still be very useful. Some of the notable shortcomings:

- It supports only logical AND conditions, OR is not available yet
- It can only be used to filter a single entity at a time, no joins are possible
